AS69RC Slips When Towing

KEEP THOSE TRANNYS ROLLING | SEPTEMBER - 2023
© September 1, 2023 • 323 Views • 10 Min Read

In this issue of Keep Those Trannys Rolling, we are going to take a look at a 2018 Ram 4500 Cab & Chassis Flatbed Tow Truck equipped with a 6.7D engine and an AS69RC transmission that was experiencing a slipping concern when carrying heavy loads or towing a vehicle. We first became aware of this vehicle when our local tow company towed in a vehicle for a transmission repair. After dropping the vehicle off in our yard, the tow truck driver entered the office to take care of the paperwork. While taking care of the paperwork, the driver commented that he was experiencing a lack of power or possibly a transmission slipping concern while towing vehicles. He said the truck runs great while it's empty, but as soon as he hooks another vehicle to it, the truck seems to lose power or slips while driving down the road. The driver also indicated that the "ck engine" light would sometimes flash, but it was not staying on. We contacted the tow company's dispatcher and requested permission to inspect their tow truck. With the tow truck driver standing by, we began our initial inspection.

Your #1 Source for 45/50 Valve Body Repairs
800px X 200px

Initial Inspection:

We began our initial inspection by performing a "walk-around," looking for any obvious concerns. We opened the hood and checked for damaged harnesses or connectors. We inspected the battery and connections. We checked the fluid levels. The fluid levels were up to their proper levels, but the transmission fluid looked dark and smelled burnt. We lifted the vehicle on the rack to inspect the underside of the vehicle. We inspected the

Stop That!

One of the things we strive to do at ATRA is to provide information not only regarding repairs for the common conditions you are seeing in your shops but to also provide you with information regarding vehicle systems and their operation so you have an understanding of the components as well as how they interface in today's vehicles. With as complex as the vehicles are becoming, it is very apparent to most that many of the issues you face today have very little to do with the transmission itself, but instead, the condition may be caused by some component used by another system on the vehicle.

In 2012 GM started using a brake pedal position sensor (BPP) (sensor id # 822) and updated the software to use the sensor as an input for grade braking as well as engine and transmission operation. The BPP sensor (Figure 1) has been implemented on almost all GM models as the years have gone by. The BPP is used on both front and rear-wheel drive applications in everything from the 6-speed to the 9- and 10-speeds. Issues with the sensors or their circuits have made many a technician lose sleep at night.

GEARS Magazine Online Technical Archives Ad
800px X 200px

The brake pedal position sensor (BPP) is a potentiometer similar to an old-time throttle position sensor (TPS). The BPP utilizes two potentiometers mounted in one assembly. One potentiometer provides a signal to the PCM, while the other sensor provides a signal to the BCM. The BPP position data is then sent
